Table 1: List of tock-CSP operators, with basic processes at the top, followed by composite processes: P and Q are metavariables that stand for processes, d for a numeric expression, e for an event, a and c for channels, x for a variable, I for a set, v for an expression, g for a condition, and X for a set of events. For a channel c, $\{c\}$ is a set of events; if c is a typed channel then events are constructed using the dot notation, so that $\{c\} = \{c.v_0, ..., c.v_n\}$, where v_i ranges over the type of c.

Process	Description
Skip	Termination: terminates immediately
$\mathbf{Wait}(d)$	Delay : terminates exactly after d units of time have elapsed
$e \to P$	Prefix operator : initially offers to engage in the event e while permitting any amount of time to pass, and then behaves as P
$a?x \to P$	Input prefix: same as above, but offers to engage on channel a with any value, and stores the chosen value in x
$a?x:I\to P$	Restricted input prefix: same as above, but restricts the value of x to those in the set I
$a!v \to P$	Output prefix: same as above, but initially offers to engage on channel a with a value v
if g then P else Q	Conditional: behaves as P if the predicate g is true, and otherwise as Q
$P \square Q$	External choice of P or Q made by the environment
P ; Q	Sequence: behaves as P until it terminates successfully, and, then it behaves as Q
$P \setminus X$	Hiding : behaves like P but with all communications in the set X hidden
$P \parallel \!\!\mid Q$	Interleaving: P and Q run in parallel and do not interact with each other
$P \parallel X \parallel Q$	Generalised parallel: P and Q must synchronise on events that belong to the set X , with termination occurring only when both P and Q agree to terminate
$P \triangle Q$	Interrupt : behaves as P until an event offered by Q occurs, and then behaves as Q
$P \triangle_d Q$	Strict timed interrupt: behaves as P , and, after exactly d time units behaves as Q
$d \blacktriangleleft P$	Deadline for visible interaction: engages in an event of P in at most d time units
$\Box \ i : I \bullet P(i)$	Replicated external choice: offers an external choice over processes $P(i)$ for all i in I

Table 2: Rules that define a tock-CSP semantics for SLEEC. We use the following *metavariables* in the definitions of the rules: def as a metavariable to stand for an element of the syntactic category definitions, defS to stand for an element of definitions, elD for an eventID, mID for a measureID, T for a type, cID for a constID, v for a value, sp and subscripted counterparts for a scaleParams,r for a rule, rrS for an element of rules, rID for a ruleID, trig for a trigger, and finally resp for a response. These metavariables are also used in rules in Tables 3 and 4.

Table 3: Rules that define a tock-CSP semantics for SLEEC triggers. Additional metavariables used here are as follows: AR for an alphabet (set) of events, sp and fp for tock-CSP processes, mBE for an mBoolExpr, and MIDs for a list of measureID elements.

Table 4: Rules for the tock-CSP semantics of SLEEC responses. Additional metavariables used here are: const for a constraint, ARDS for a set of events, mp for a process, tU for a timeUnit, n for an index (a natural number), dfts for an element of defeaters, and dft for a defeater.
